

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended): An imaging apparatus comprising:

image capturing means for obtaining image data;

image selection means for selecting a desired portion of the image data to be sent to an addressee that generates printed matter therefrom; and

image storage means for storing the image data obtained by the imaging means and the portion of the image data selected by the image selection means as selected image data;

communication means for carrying out data communication with wireless communication equipment;

addressee storage means for storing the addressee;

authentication information storage means for storing authentication information that is necessary for the data communication with the wireless communication equipment; and

control means for carrying out judgment as to whether or not the communication means is within a communicable range of the wireless communication equipment and for controlling the communication means so as to send the authentication information stored in the authentication information storage means to the wireless communication equipment by carrying

out the data communication with the wireless communication equipment in the case where a result of the judgment is affirmative and so as to send image apparatus information together with the selected image data to the addressee via the wireless communication equipment after the wireless communication equipment authenticates the imaging apparatus according to the authentication information.

2. (canceled).

3. (withdrawn): An imaging apparatus as defined in Claim 2, wherein at least the communication means is installed in a dedicated chip that is detachable from the imaging apparatus.

4. (currently amended): A data communication apparatus connected to an imaging apparatus defined in Claim 1 for sending the selected image data to the addressee by reading the selected image data from the image storage means, the data communication apparatus comprising:

communication means for carrying out data communication with wireless communication equipment;

addressee storage means for storing the addressee;

authentication information storage means for storing authentication information that is necessary for carrying out the data communication with the wireless communication equipment; and

control means for controlling the communication means so as to send the authentication information stored in the authentication information storage means to the wireless communication equipment by carrying out the data communication with the wireless communication equipment and so as to send the selected image data to the addressee via the wireless LAN-communication equipment after the wireless communication equipment authenticates the data communication apparatus according to the authentication information.

5. (original): A data communication apparatus as defined in Claim 4, further comprising recharging means for recharging the imaging apparatus.

6. (original): An imaging apparatus comprising:

image capturing means for obtaining image data;

image selection means for selecting a desired portion of the image data as selected image data for generating printed matter therefrom;

image storage means comprising a first storage area for storing the selected image data and a second storage area for storing the remaining image data; and

image output means for outputting the selected image data to an external apparatus that generates the printed matter, by reading the selected image data from the first storage area.

7. (withdrawn): An imaging apparatus as defined in Claim 6, further comprising:

image processing means for obtaining processed image data by carrying out image processing on the remaining image data stored in the second storage area of the image storage means, wherein

the image selection means receives selection as the selected image data from the remaining image data from which the processed image data have been generated.

8. (withdrawn): An imaging apparatus defined in Claim 6, further comprising:

communication means for sending the remaining image data stored in the second storage area in the image storage means to external image processing means that obtains processed image data by carrying out image processing on the image data, and for receiving the processed image data, wherein

the image selection means receives selection as the selected image data from the remaining image data from which the processed image data have been generated.

9. (withdrawn): An imaging apparatus as defined in Claim 6, wherein the image output means is also means for deleting the selected image data from the first storage area in the image storage means after outputting the selected image data.

10. (withdrawn): An imaging apparatus as defined in Claim 9, further comprising thumbnail image generation means for generating thumbnail image data of the selected image data and for storing the thumbnail image data in the image storage means.

11. (original): An imaging apparatus as defined in Claim 6, further comprising:

 order information generation means for generating order information representing the content of an order regarding the selected image data, wherein

 the image output means is means for outputting the order information together with the selected image data.

12. (withdrawn): An imaging apparatus defined in Claim 11, further comprising order information storage means for storing the order information after the selected image data have been sent.

13. (currently amended): An imaging apparatus comprising:

image capturing means for obtaining image data;

image selection means for selecting a desired portion of the image data as selected
image data for generating printed matter therefrom;

image storage means comprising a first storage area for storing the selected image
data and a second storage area for storing the remaining image data;

image output means for outputting the selected image data to an external
apparatus that generates the printed matter, by reading the selected image data from the first
storage area; and

control means for carrying out judgment as to whether or not the communication
means is within a communicable range of the wireless communication equipment and for
controlling the image output means so as to ~~have the same~~ send the selected image data to the
external apparatus that generates the printed matter when it is judged by the control means that
the communication means is within the communicable range of the wireless communication
equipment.

14. (currently amended): An imaging apparatus comprising:

a camera housing,

an image capturing system provided in the housing for obtaining image data;

a manually operable print order button provided on the camera body for selecting a desired portion of the image data to be sent to an addressee that generates printed matter therefrom; and

an image output system provided in the camera body for outputting the selected image data to the addressee that generates the printed matter;

communication means for carrying out data communication with wireless communication equipment;

addressee storage means for storing the addressee;

authentication information storage means for storing authentication information that is necessary for the data communication with the wireless communication equipment; and

control means for carrying out judgment as to whether or not the communication means is within a communicable range of the wireless communication equipment and for controlling the communication means so as to send the authentication information stored in the authentication information storage means to the wireless communication equipment by carrying out the data communication with the wireless communication equipment in the case where a result of the judgment is affirmative and so as to send image apparatus information together with the selected image data to the addressee via the wireless communication equipment after the wireless communication equipment authenticates the imaging apparatus according to the authentication information.

15. (new): An imaging apparatus as defined in Claim 1, wherein the communication means sends the selected image data in an ascending order of photography data.

16. (new): An imaging apparatus as defined in Claim 14, wherein the communication means sends the selected image data in an ascending order of photography data.

17. (new): An imaging apparatus as defined in Claim 1, wherein the imaging apparatus information includes at least one of model information and photography condition information, which includes information of a photography condition used at a time of obtaining the image data.

18. (new): An imaging apparatus as defined in Claim 14, wherein the imaging apparatus information includes at least one of model information and photography condition information, which includes information of a photography condition used at a time of obtaining the image data.
